

# IEE 222 - Tutorial

## Tutorial 3: LP Modeling (Simple Form)

An oil refinery can buy two types of oil: <sup>\$11</sup>light crude oil and <sup>\$9</sup>heavy crude oil. The cost per barrel of these types is respectively \$11 and \$9. The following quantities of gasoline, kerosene, and jet fuel are produced per barrel of each type of oil.

|   |                       | Gasoline |   | Kerosene |   | Jet Fuel |
|---|-----------------------|----------|---|----------|---|----------|
| → | Light crude oil $x_1$ | 0.4      | + | 0.2      | + | 0.35     |
| — | Heavy crude oil $x_2$ | 0.32     | + | 0.4      | + | 0.2      |

Note that 5% and 8% of the crude are lost respectively during the refining process. The refinery has contracted to deliver 1 million barrels of gasoline, 400,000 barrels of kerosene, and 250,000 barrels of jet fuel. Formulate the problem of finding the number of barrels of each crude oil that satisfy the demand and minimize the total cost as a linear program.

Let  $x_1$  = # barrels of light crude oil  
 $x_2$  = ~ ~ ~ heavy ~ ~ ~

$$\min \quad 11x_1 + 9x_2$$

$$\begin{array}{lll}
 \text{gasoline demand} & 0.4x_1 + 0.32x_2 & \geq 1,000,000 \\
 \text{kerosene} & 0.2x_1 + 0.4x_2 & \geq 400,000 \\
 \text{jet fuel} & 0.35x_1 + 0.2x_2 & \geq 250,000 \\
 & x_1, x_2 \geq 0
 \end{array}$$

A company manufactures an assembly consisting of a frame, a shaft, and a ball bearing. The company manufactures the shafts and frames but purchases the ball bearings from a ball bearing manufacturer. Each shaft must be processed on a forging machine, a lathe, and grinder. These operations require 0.5 hours, 0.2 hours, and 0.3 hours per shaft, respectively. Each frame requires 0.8 hours on a forging machine, 0.1 hours on a drilling machine, 0.3 hours on a milling machine, and 0.5 hours on a grinder. The company has 5 lathes, 10 grinders, 20 forging machines, 3 drillers, and 6 millers. Assume that each machine operates a maximum of 2400 hours per year. Formulate the problem of finding the maximum number of assembled components that can be produced as a linear program.

Let  $x_1$  : # shafts  $\rightarrow$  lathe  
 $x_2$  : # frames  $\rightarrow$  grinders  
 $z$  : # assemblies  $\rightarrow$  forging

Max  $z$

Constraints:  
 lathe:  $5 \times 2400 = 12,000$  hrs  
 grinders:  $10 \times 2400 = 24,000$   
 forging:  $20 \times 2400 = 48,000$   
 drilling:  $3 \times 2400 = 7,200$   
 milling:  $6 \times 2400 = 14,200$

s.t.

$$\begin{aligned}
 \text{lathe} \quad & 0.2x_1 \leq 12,000 \\
 \text{grind.} \quad & 0.3x_1 + 0.5x_2 \leq 24,000 \\
 \text{forg.} \quad & 0.5x_1 + 0.8x_2 \leq 48,000 \\
 \text{drill.} \quad & 0.1x_2 \leq 7,200 \\
 \text{mill.} \quad & 0.3x_2 \leq 14,200 \\
 & z \leq x_1 \\
 & z \leq x_2 \\
 & x_1, x_2 \geq 0
 \end{aligned}$$

| Comp. | lathe | grind | forg. | drill | mill |
|-------|-------|-------|-------|-------|------|
| $x_1$ | 0.2   | 0.3   | 0.5   | -     | -    |
| $x_2$ | -     | 0.5   | 0.8   | 0.1   | 0.3  |

A manufacturer of plastics is planning to blend a new product from four chemical compounds. These compounds are mainly composed of three elements A, B, and C. The composition and unit cost of these chemicals are shown below.

| Chemical Compound      | 1  | 2  | 3  | 4  |
|------------------------|----|----|----|----|
| % of A                 | 30 | 20 | 40 | 20 |
| % of B                 | 20 | 60 | 30 | 40 |
| % of C                 | 40 | 15 | 25 | 30 |
| → <u>Cost/kilogram</u> | 20 | 30 | 20 | 15 |

 $x_1$  $x_2$  $x_3$  $x_4$ 

The new product consists of 20% element A, at least 30% element B, and at least 20% element C. Owing to side effects of compounds 1 and 2, they must not exceed 30% and 40% of the content of the new product. Formulate the problem of finding the least costly way of blending as a linear program.

#### Decision Variables:

- $x_1$ : amount of compound 1 used to form 1 kg of the product
- $x_2$ : amount of compound 2 used to form 1 kg of the product
- $x_3$ : amount of compound 3 used to form 1 kg of the product
- $x_4$ : amount of compound 4 used to form 1 kg of the product

| Chemical Compound | 1  | 2  | 3  | 4  |
|-------------------|----|----|----|----|
| % of A            | 30 | 20 | 40 | 20 |
| % of B            | 20 | 60 | 30 | 40 |
| % of C            | 40 | 15 | 25 | 30 |
| Cost/kilogram     | 20 | 30 | 20 | 15 |

$$\min \quad 20x_1 + 30x_2 + 20x_3 + 15x_4$$

% A

$$0.3x_1 + 0.2x_2 + 0.4x_3 + 0.2x_4 = 0.2$$

at least  
30%  
% B

$$0.2x_1 + 0.6x_2 + 0.3x_3 + 0.4x_4 \geq 0.3$$

20%  
% C

$$0.4x_1 + 0.15x_2 + 0.25x_3 + 0.3x_4 \geq 0.2$$

$$x_1 \leq 0.3$$

$$x_2 \leq 0.4$$

$$x_1, x_2, x_3, x_4 \geq 0$$

$x_5 \leq 30\%$

A steel manufacturer produces four sizes of I beams: small, medium, large, and extra large . These beams can be produced on any one of three machine types: A, B, and C. The lengths in feet of the I beams that can be produced on the machines per hour are summarized below.

| Beam          | Machine |     |     |
|---------------|---------|-----|-----|
|               | A       | B   | C   |
| Small 1       | 300     | 600 | 800 |
| Medium 2      | 250     | 400 | 700 |
| Large 3       | 200     | 350 | 600 |
| Extra Large 4 | 100     | 200 | 300 |

Assume that each machine can be used up to 50 hours per week and that the hourly operating costs of these machines are respectively \$30, \$50, and \$80. Further suppose that 10,000, 8,000, 6,000, and 6,000 feet of the different-size I beams are required weekly. Formulate the machine scheduling problem as a linear program.

$$\rightarrow x_1, x_2, x_3 : \# \text{ hrs } \dots$$

machine

$X_{11}$ : number of hours of M/C 1 on beam size 1  
 $X_{12}$ : number of hours of M/C 1 on beam size 2  
 $X_{13}$ : number of hours of M/C 1 on beam size 3  
 $X_{14}$ : number of hours of M/C 1 on beam size 4

\$30

$X_{21}$ : number of hours of M/C 2 on beam size 1  
 $X_{22}$ : number of hours of M/C 2 on beam size 2  
 $X_{23}$ : number of hours of M/C 2 on beam size 3  
 $X_{24}$ : number of hours of M/C 2 on beam size 4

\$50

$X_{31}$ : number of hours of M/C 3 on beam size 1  
 $X_{32}$ : number of hours of M/C 3 on beam size 2  
 $X_{33}$ : number of hours of M/C 3 on beam size 3  
 $X_{34}$ : number of hours of M/C 3 on beam size 4

\$80

M/C availability constraints

$$\min \quad 30(X_{11} + X_{12} + X_{13} + X_{14}) + 50(X_{21} + X_{22} + X_{23} + X_{24}) + 80(X_{31} + X_{32} + X_{33} + X_{34})$$

$$\begin{cases} X_{11} + X_{12} + X_{13} + X_{14} \leq 50 \\ X_{21} + X_{22} + X_{23} + X_{24} \leq 50 \\ X_{31} + X_{32} + X_{33} + X_{34} \leq 50 \end{cases}$$

demand constraints

Size

$$\begin{array}{lcl} 1 & 300 X_{11} + 600 X_{21} + 800 X_{31} & \geq 10,000 \\ 2 & 250 X_{12} + 400 X_{22} + 700 X_{32} & \geq 8,000 \\ 3 & 200 X_{13} + 350 X_{23} + 600 X_{33} & \geq 6,000 \\ 4 & 100 X_{14} + 200 X_{24} + 300 X_{34} & \geq 6,000 \end{array}$$

$$X_{11}, X_{12}, X_{13}, \dots, X_{34} \geq 0$$

A furniture manufacturer has three plants, which need 500, 700, and 600 tons of lumber weekly.  The manufacturer may purchase the lumber from three lumber companies. The first two lumber manufacturers virtually have unlimited supply, and because of other commitments the third manufacturer cannot ship more than 500 tons weekly. The first lumber manufacturer uses rail for transportation and there is no limit on tonnage that can be shipped to the furniture facilities. On the other hand, the last two lumber companies use trucks that limit the maximum tonnage that can be shipped to any of the furniture companies to 200 tons. The following table gives the transportation cost from the lumber companies to the furniture manufacturers (\$ per ton).

| Lumber Company | Furniture Facility |     |     |
|----------------|--------------------|-----|-----|
|                | 1                  | 2   | 3   |
| 1              | 2                  | 3   | 5   |
| 2              | 2.5                | 4   | 4.8 |
| 3              | 3                  | 3.6 | 3.2 |

Formulate the problem as a linear program.

$X_{11}$ : number of tons to be shipped from lumber company 1 to plant 1  
 $X_{12}$ : number of tons to be shipped from lumber company 1 to plant 2  
 $X_{13}$ : number of tons to be shipped from lumber company 1 to plant 3

$X_{21}$ : number of tons to be shipped from lumber company 2 to plant 1  
 $X_{22}$ : number of tons to be shipped from lumber company 2 to plant 2  
 $X_{23}$ : number of tons to be shipped from lumber company 2 to plant 3

$X_{31}$ : number of tons to be shipped from lumber company 3 to plant 1  
 $X_{32}$ : number of tons to be shipped from lumber company 3 to plant 2  
 $X_{33}$ : number of tons to be shipped from lumber company 3 to plant 3

## Homework

The technical staff of a hospital wishes to develop a computerized menu-planning system. To start with, a lunch menu is sought. The menu is divided into three major categories: vegetables, meat, and dessert. At least one equivalent serving of each category is desired. The cost per serving of some suggested items as well as their content of carbohydrates, vitamins, protein, and fats is summarized in the next slide.

Suppose that the minimal requirements of carbohydrates, vitamins, protein, and fats per meal are respectively 5, 10, 10, and 2. Formulate the menu-planning problem as a linear program.

|                   | Carbs | Vitamins | Protein | Fats | Cost in \$/serving |
|-------------------|-------|----------|---------|------|--------------------|
| <b>Vegetables</b> |       |          |         |      |                    |
| Peas              | 1     | 3        | 1       | 0    | 0.1                |
| Green beans       | 1     | 5        | 2       | 0    | 0.12               |
| Okra              | 1     | 5        | 1       | 0    | 0.13               |
| Corn              | 2     | 6        | 1       | 2    | 0.09               |
| Macaroni          | 4     | 2        | 1       | 1    | 0.1                |
